Database migrations

Generate migrations through Prisma from the repository root. Once a migration has been applied to a shared environment, add a new migration instead of editing the existing one.

Service types added on 2026-09-08

`20260908120000_add_order_service_types` adds `FUEL_SENSOR` and `EQUIPMENT_REPLACEMENT` without replacing the enum or updating historical orders. Apply it before deploying consumers that use the new values. PostgreSQL requires committing an enum addition before using its value in the same migration sequence (ALTER TYPE documentation).

The application supports both values in service configuration, orders, pricing and Google Sheets synchronization. `FUEL_SENSOR` selects available stock for installation; `EQUIPMENT_REPLACEMENT` links an installed device to its replacement. Their workflow and workbook rules are documented in `docs/technician-workbook-contract.md`. This migration note is historical and does not mean the values are still awaiting approval. `Order.technicianId` remains nullable for historical records. Regularization must use verified technician assignments and audit each change; no automatic backfill or `NOT NULL` constraint is introduced.
